OOP Adventures Project

In this project you will be working with a partner to create a text based adventure game using the principles of Object Oriented Programming.

The game's logic will be organized into Classes in Python. The classes will manage the main character, NPC's, scoring and any items you need to manage. You may choose to develop any type of game you like as long as it is school appropriate.

Evidence of Mastery of Object Oriented Programming (OOP) will include

Category	Not Yet	Approaching	Mastery
Use of Classes for Organizing Methods: Regularly used functions are organized into class methods related to their functionality			
Flowchart/Planning: Evidence of planning, including a flowchart and design document should be present			
Inheritance: Child classes inherit from parents in a meaningful way			
Modules: Python program is separated into different files loaded into 1 main app.py			
Error Handling: Functions/logic account for errors and redirect users when needed			
Data Structures: Proper data structures (List, Tuple, Dictionary) are used to			

organize data effectively and efficiently			
Conditional Statements: Conditional statements are used effectively for decision making			
Game Complexity: Game has aspects of scoring, long term data maintenance (life points or money or items etc.), a user character.			
Git Branches: Students effectively use git branches for maintaining codebase
